PRESENTAZIONE CLINICA

Sintomatica

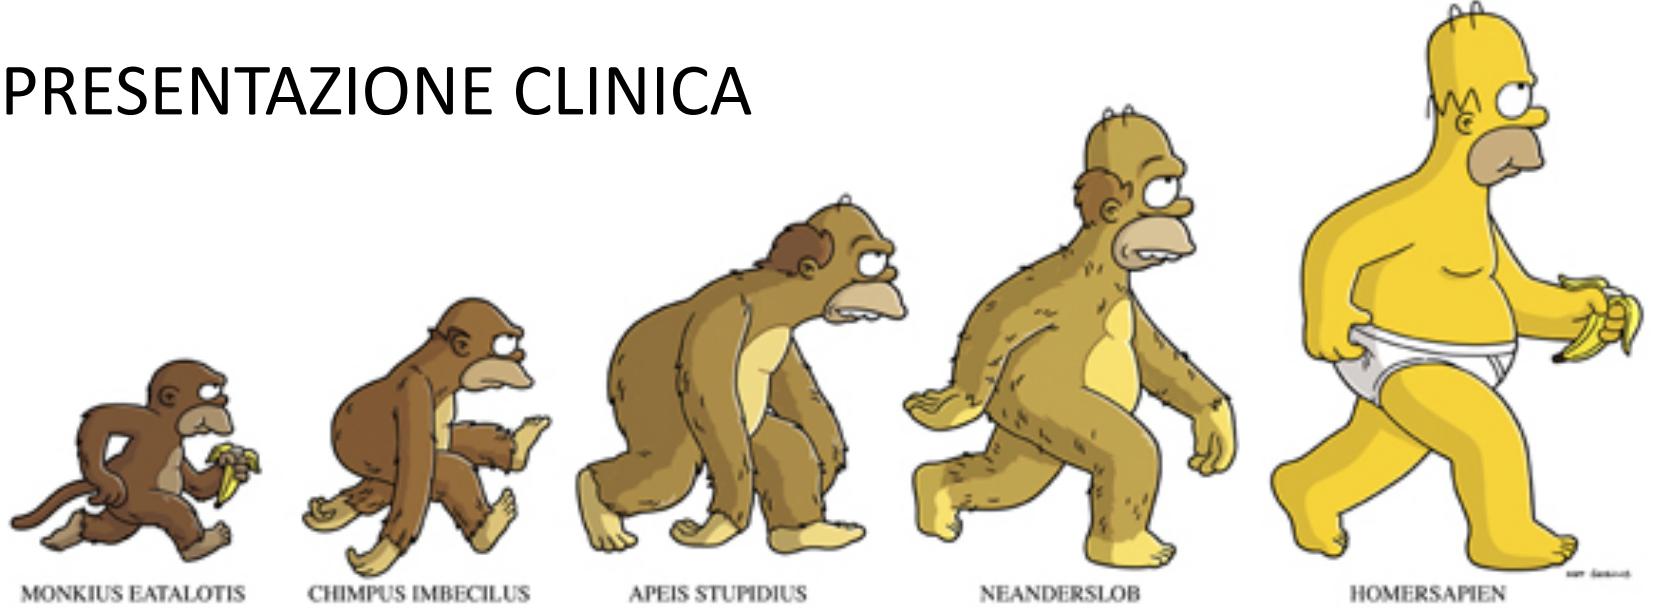

Asintomatica

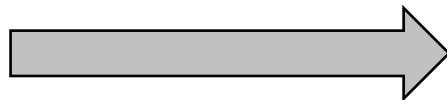

In the first 343 cases of PHPT seen at Massachusetts General Hospital, 57% had urolithiasis, 23% had parathyroid bone disease, and 8% had peptic ulcer disease.

Cope O. N Engl J Med 1966

PRESENTAZIONE CLINICA

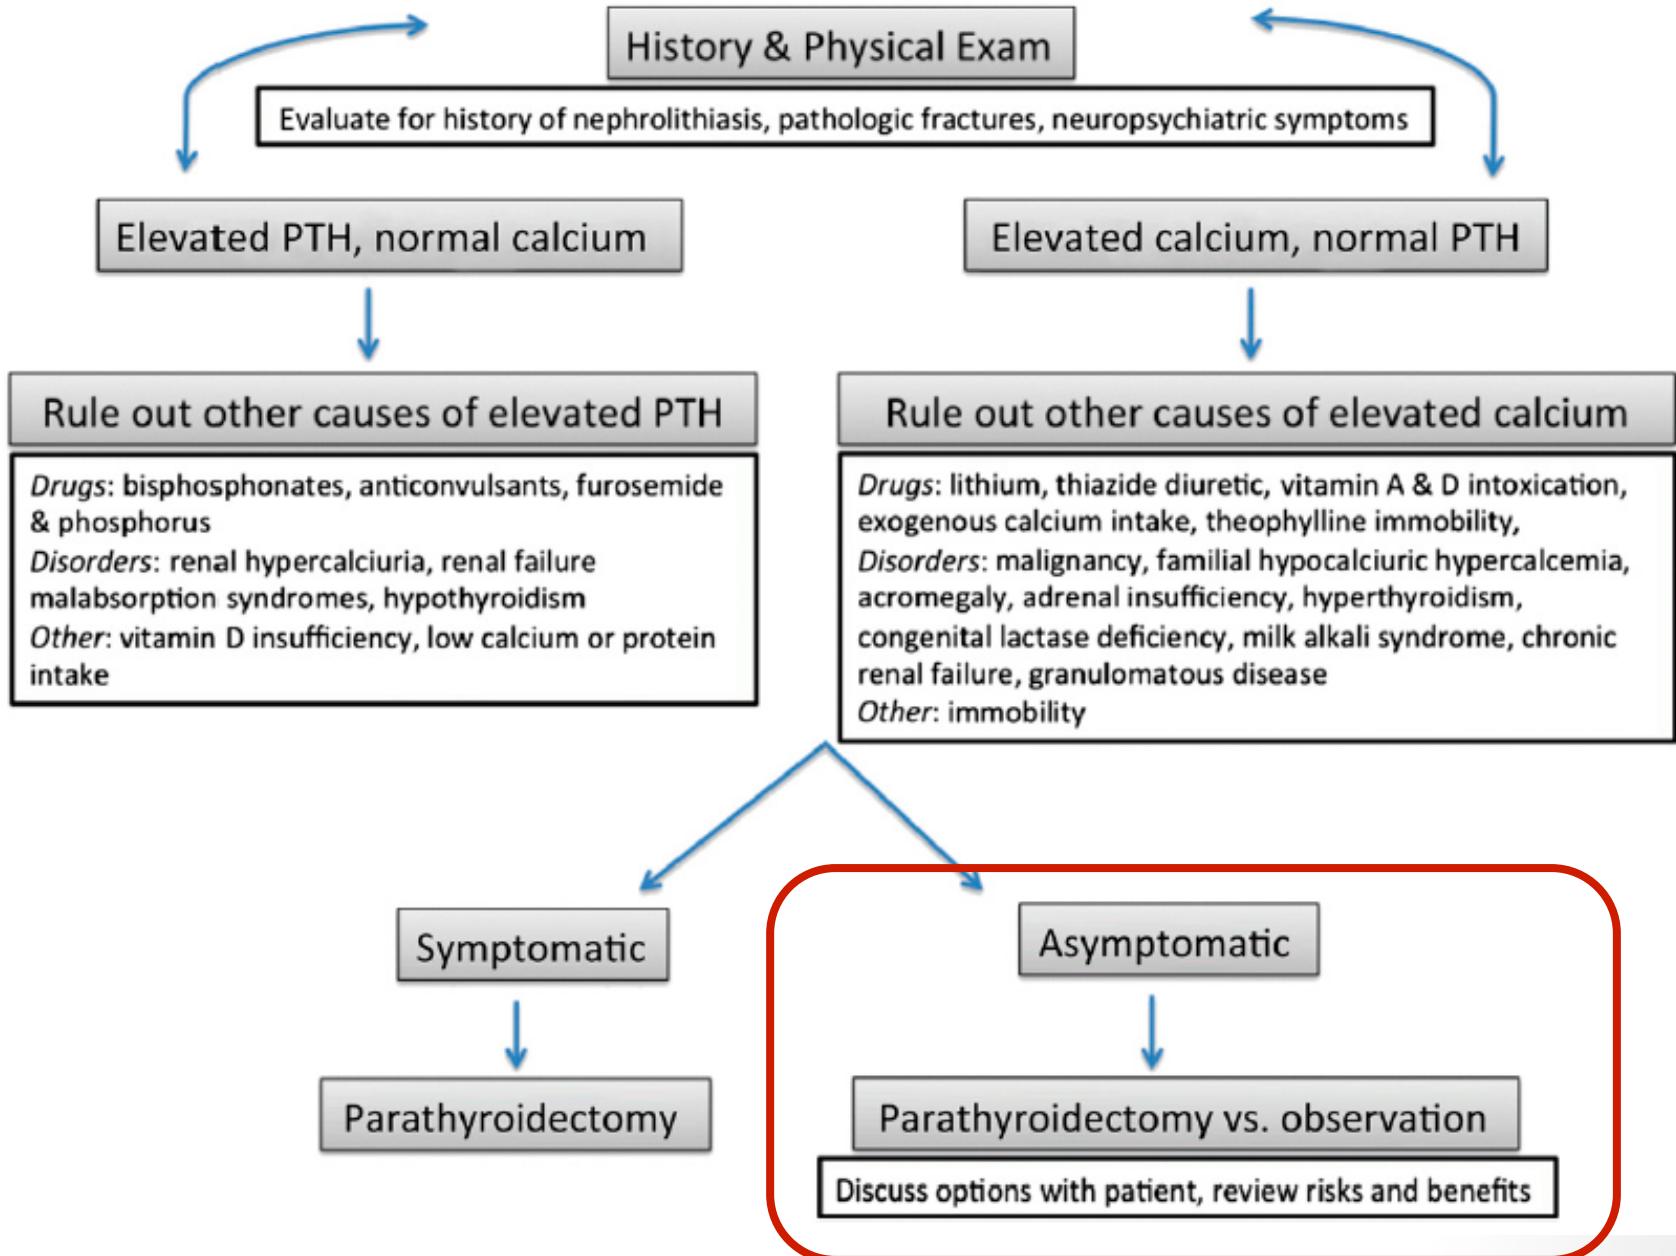

Sintomatica

Asintomatica

Oggi circa
l'80% dei pazienti con PHPT
sono asintomatici

Parameter

Serum calcium:

1 mg/dL (0.25 mmol/L) > upper limit of normal

BMD by DXA:

T score < -2.5 at lumbar spine, femoral neck, total hip, or distal 1/3 radius

Detection of vertebral fractures

by X-rays, VFA, MRI or CT

Serum creatinine

Estimated creatinine clearance (eGFR) <60 mL/min

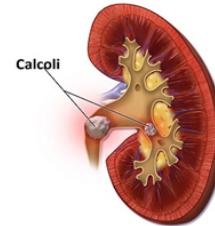

24-h urine:

Daily urinary calcium excretion >400 mg/day and increased stone risk by the urinary biochemical stone risk profile

Presence of nephrolithiasis or nephrocalcinosis (by X-ray, ultrasound or CT)

Age <50 years

DIAGNOSI

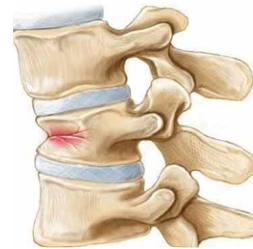

Litiasi

Calcolo eGFR

Osteoporosi

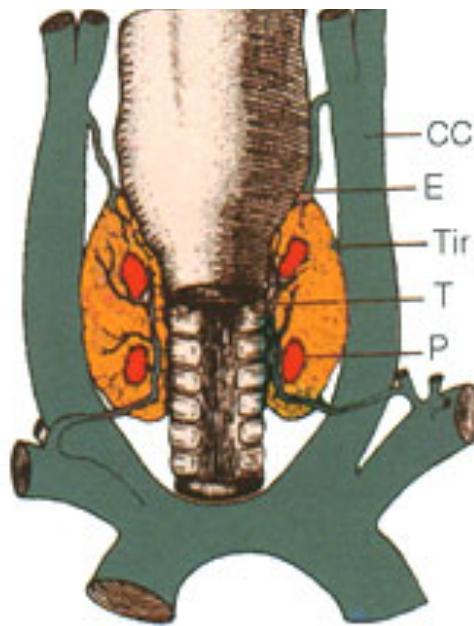

Fratture

SEDI DI LOCALIZZAZIONE

Le paratiroidi inferiori sono di norma posizionate in prossimità della faccia infero-laterale dei poli tiroidei inferiori

Le paratiroidi superiori si trovano adiacenti alla faccia dorso laterale della tiroide, all'altezza dell'istmo.

80 – 85 %

delle lesioni paratiroidee
si trovano
nella loro sede abituale

PARATIROIDI ECTOPICHE

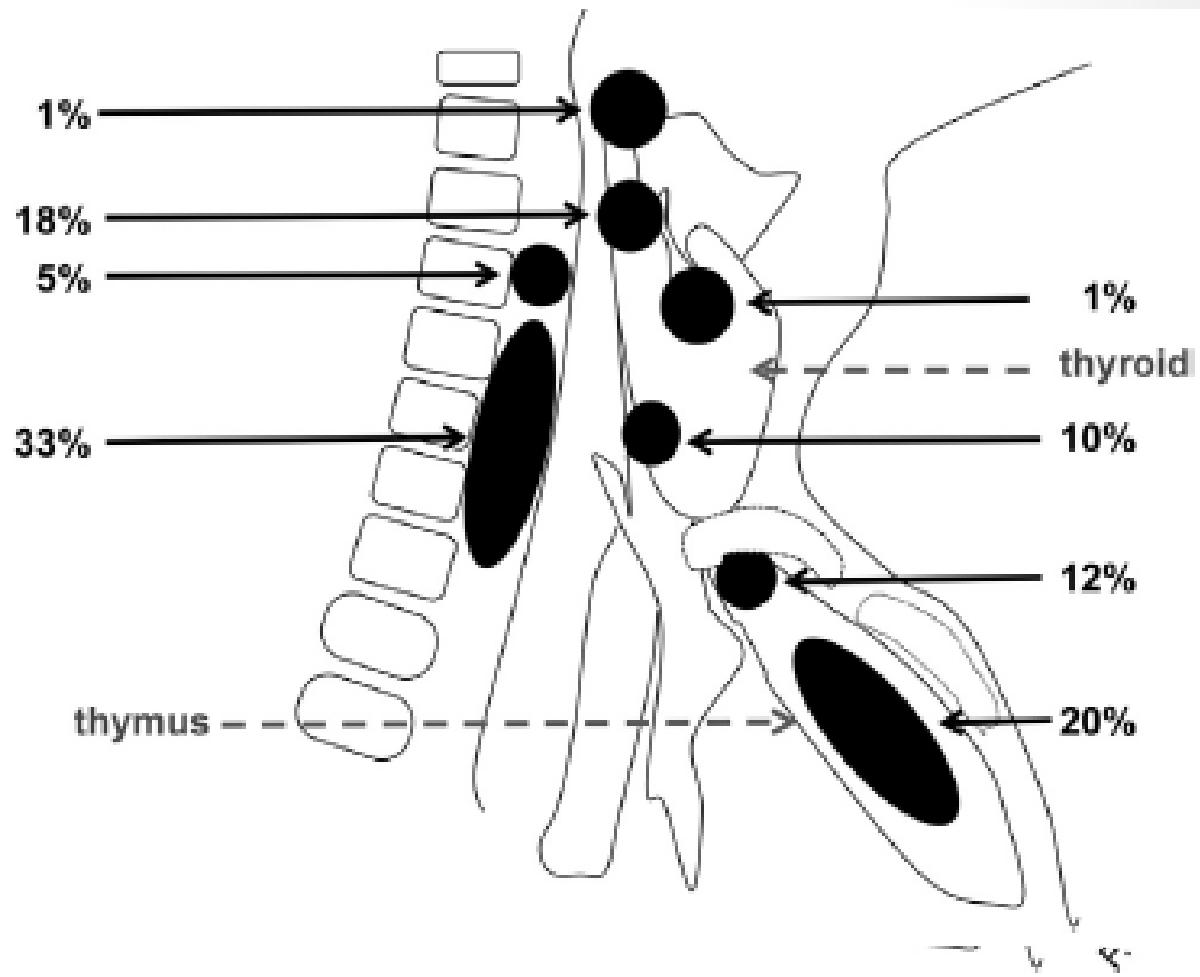

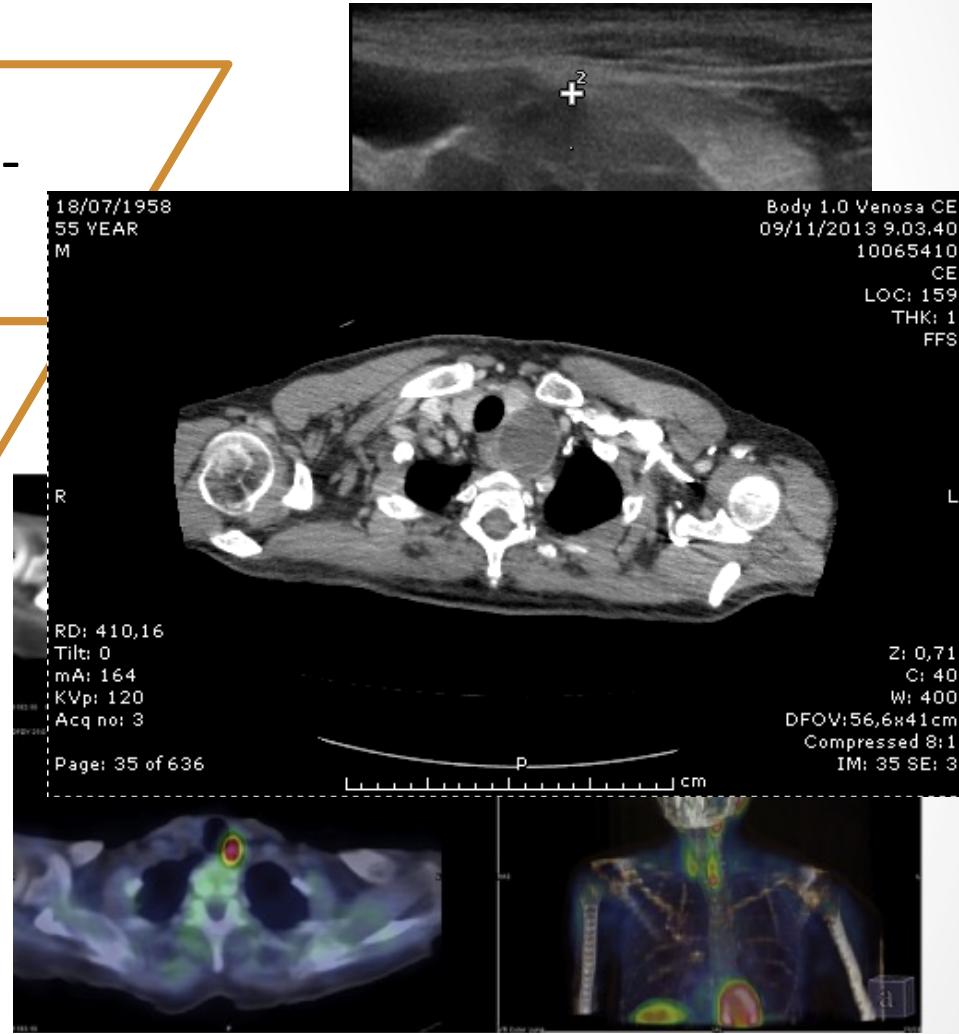

FIGURE 35.1 Distribution of hyperfunctioning parathyroid glands according to anatomic location. A total of 104 lesions found at re-operation in a single institution (Massachusetts General Hospital, Harvard Medical School, Boston, MA) because of recurrent PHPT after prior conventional four-gland exploration surgery from 1930 to 1975. The most common ectopic sites (about 65% of the total) mirror the route of descent of the lower parathyroid glands, with a long migration path associated with descent of the thymus.

SIAMO PRONTI PER L'INTERVENTO CHIRURGICO ??

CENTRAL NERVOUS SYSTEM

- Impaired concentration and memory
- Fatigue
- Muscle weakness
- Cognitive impairment
- Depression
- Psychosis
- Altered consciousness (confusion, lethargy, stupor, coma)

RENAL SYSTEM

- Polyuria
- Dehydration
- Low urinary specific gravity
- Reduced glomerular filtration rate
- Renal failure

CARDIOVASCULAR SYSTEM

- Hypertension
- ECG alterations: shortened QT interval, prolonged PR interval, widened QRS complex, bundle branch block, Brugada syndrome (in predisposed individuals), and bradyarrhythmias
- Cardiac arrest

Intervention	Mode of action	Onset of action	Duration of action
Isotonic saline hydration	Restoration of intravascular volume Increases urinary calcium excretion	Hours	During infusion
Calcitonin	Inhibits bone resorption via interference with osteoclast function Promotes urinary calcium excretion	4 to 6 hours	48 hours
Bisphosphonates	Inhibit bone resorption via interference with osteoclast recruitment and function	24 to 72 hours	2 to 4 weeks
Loop diuretics*	Increase urinary calcium excretion via inhibition of calcium reabsorption in the loop of Henle	Hours	During therapy
Glucocorticoids	Decrease intestinal calcium absorption Decrease 1,25-dihydroxyvitamin D production by activated mononuclear cells in patients with granulomatous diseases or lymphoma	2 to 5 days	Days to weeks
Denosumab	Inhibits bone resorption via inhibition of RANKL	4 to 10 days	4 to 15 weeks
Calcimimetics	Calcium sensing receptor agonist, reduces PTH (parathyroid carcinoma, secondary hyperparathyroidism in CKD)	2 to 3 days	During therapy
Dialysis	Low or no calcium dialysate	Hours	During treatment

IPERCALCEMIA LIEVE

10,2/10,4 – 12 mg/dL

Ipercalcemia asintomatica o lieve (calcemia < 12 mg/dL)

- Non richiede trattamento immediato.
- Evitare fattori che possano aggravare l'ipercalcemia
- Diuretici tiazidici, carbonato di litio, deplezione di volume, prolungato allattamento
- Idratazione adeguata (almeno dai 6 agli 8 bicchieri di acqua al giorno) per minimizzare il rischio di nefrolitiasi.

IPERCALCEMIA MODERATA

12 – 14 mg/dL

Ipercalcemia cronica moderata asintomatica o lievemente sintomatica
(calcemia compresa tra 12 e 14 mg/dL)

- potrebbe non richiedere un trattamento immediato
- Stesse precauzioni descritte per l'ipercalcemia lieve

Aumento acuto della calcemia

- potrebbe causare un'alterazione del sensorio e potrebbe richiedere una terapia più aggressiva simile all'ipercalcemia grave
- Trattamento con soluzione fisiologica e bisfosfonati come nell'ipercalcemia grave

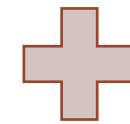

IPERCALCEMIA GRAVE

> 14 mg/dL

aumento del volume
urinario dovuto
all'inibizione diretta del
riassorbimento tubulare
renale del sodio e
dell'acqua

alla riduzione
dell'apporto di liquidi
dovuta all'anoressia,
alla nausea e al
vomito

IPERCALCEMIA GRAVE

IDRATAZIONE

Espansione del volume con una soluzione salina isotonica

Velocità di infusione
iniziale di 200 – 300 mL/h

3 – 4 Litri
nelle prime 24 h

2 – 3 Litri
nei giorni successivi

Diuresi = 100 – 150 mL /h

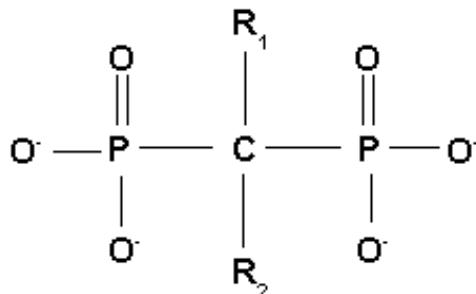

IPERCALCEMIA GRAVE

IDRATAZIONE

IPERCALCEMIA GRAVE

BISFOSFONATI

Derivati del pirofosfato a cui il ponte P-O-P è stato sostituito con un ponte P-C-P non idrolizzabile.

Inibiscono l'azione degli osteoclasti

Acido Zoledronico

Più potente

1 fl da 4 mg in 100cc di soluzione fisiologica in 15 minuti

Riduzione della calcemia più velocemente e più a lungo

Reazione di fase acuta

Filtrato glomerulare

< 30 ml/min

DENOSUMAB?

Vitamina D ?

Clinical Endocrinology (2014) 80, 797–803

ORIGINAL ARTICLE

Effect of 25(OH)D replacements in patients with primary hyperparathyroidism (PHPT) and coexistent vitamin D deficiency on serum 25(OH)D, calcium and PTH levels: a meta-analysis and review of literature

Viral N. Shah*, Chirag S. Shaht, Sanjay K. Bhadada† and D. Sudhakar Rao§

Conclusion Vitamin D replacement in subjects with PHPT and coexistent vitamin D deficiency increase 25(OH)D and reduce serum PTH significantly without causing hypercalcaemia and hypercalciuria. The finding of the study needs to be confirmed by a large randomized trial in patient with PHPT and coexistent vitamin D deficiency.
