# A HEALTHY SKELETON REQUIRES A BALANCE OF BONE RESORPTION AND BONE FORMATION

Roma, 8-11 novembre 2018

ITALIAN CHAPTER

# OSTEOPOROSIS / OSTEOPENIA

---

OSTEO = BONE

POROUS = VOID SPACES

OSIS = CONDITION OF

OSTEOPENIA = LOW BONE

ISCD recommend that  
reports should use the  
term **low bone mass** and  
not osteopenia

# PHYSIOLOGICAL REMODELLING - BONE QUALITY

## INSUFFICIENT TURNOVER

- Accumulation of microdamage
- Increased brittleness due to excessive mineralization

## EXCESSIVE TURNOVER

- Increase in stress risers (weak zones)
- Increase in perforation
- Loss of connectivity

Adapted from Weinstein RS. *J Bone Miner Res* 15: 621, 2000

Roma, 8-11 novembre 2018

ITALIAN CHAPTER

# EXCESSIVE REMODELLING CONTRIBUTES TO OSTEOPOROSIS

Normal Quantity and Architecture

Loss of Quantity

Loss of Quantity and Architecture

Increased bone remodelling

Structural deterioration

Increased skeletal fragility

Increased fracture risk

# SCOPE OF THE PROBLEM

Osteoporosis is estimated to affect 200 million women worldwide - approximately:

one-tenth of women aged 60,  
one-fifth of women aged 70,  
two-fifths of women aged 80 and  
two-thirds of women aged 90

Osteoporosis affects an estimated 75 million people in Europe, USA and Japan

# OSTEOPOROSIS RELATED FRACTURES

A fracture that should have not happened:

- Metatarsal bones while dancing
- Fibula while walking
- Lumbar spine while lifting water
- Ribs while coughing...

Fragility fractures or low-trauma fractures occurring with minimal trauma - a force equal to or less than falling from standing height

# INCIDENCE OF OSTEOPOROTIC FRACTURE

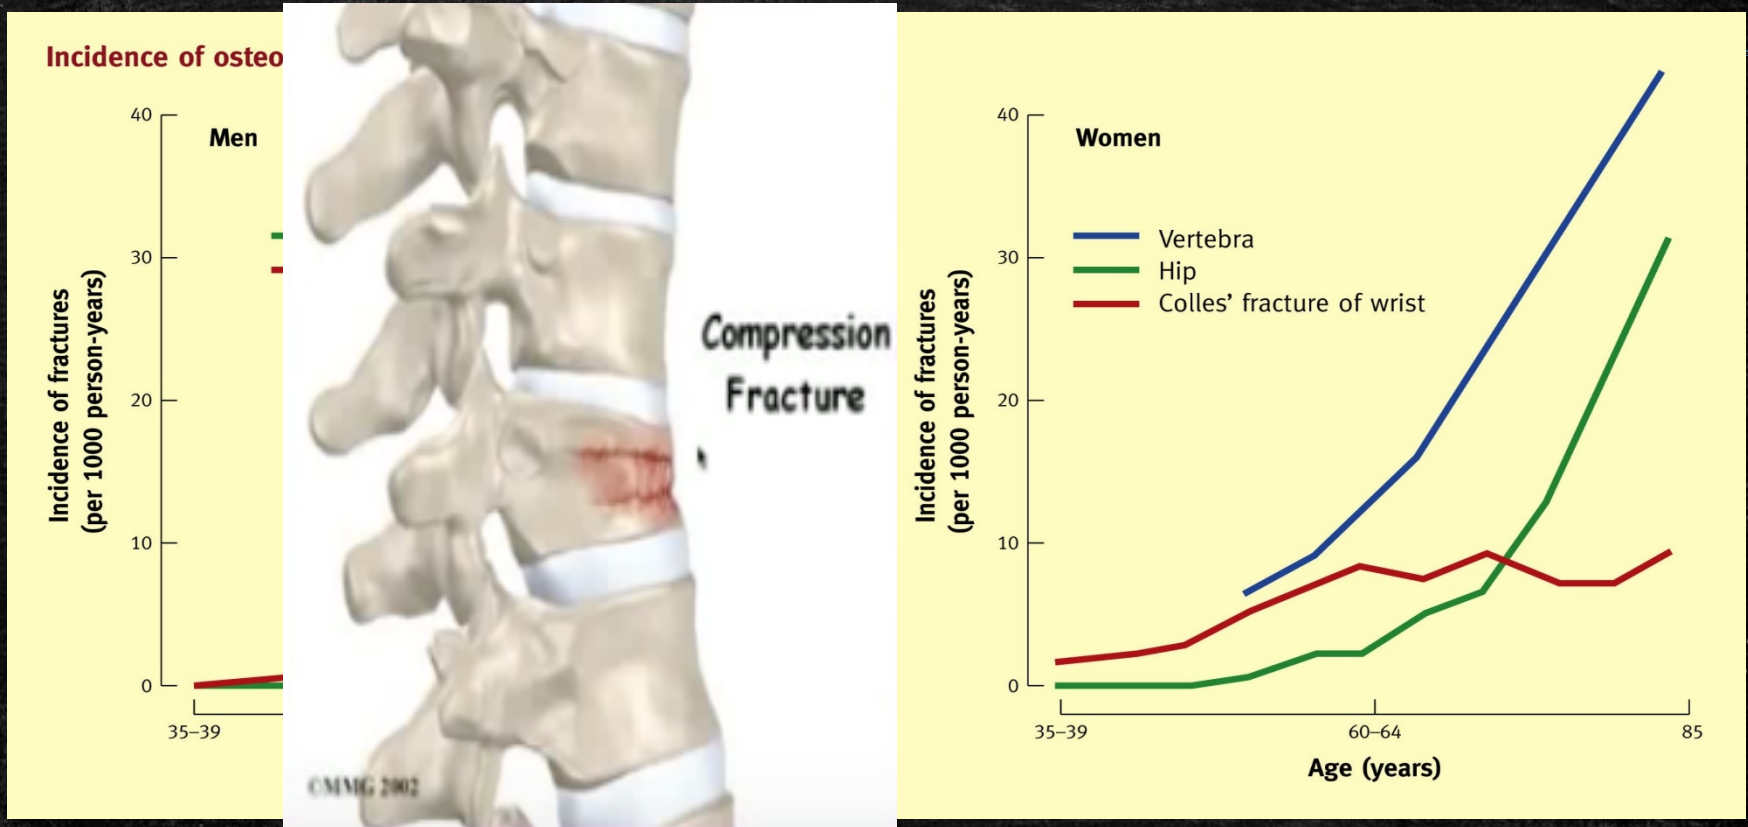

Figure 2 Incidence of osteoporotic fractures.

Richard Eastell  
 Identification and management of osteoporosis in older adults  
 Medicine Volume 41, Issue 1 2013 47 - 52

Roma, 8-11 novembre 2018

ITALIAN CHAPTER

# HIP FRACTURE

By 2050, the worldwide incidence of hip fracture in men is projected to increase by 310% and 240% in women, compared to rates in 1990

Hip strength and flexibility protect against hip fracture

Roma, 8-11 novembre 2018

ITALIAN CHAPTER

# MORTALITY and DISABILITY

## MORTALITY

- 5% immediately
- 25% in 1 year (as breast cancer)

## DISABILITY

- 20% compromised functional status
- 50% reduction in mobility and related functions
- if invalid 20-25% hospitalization

Table 4

### Cause of Death 1 Year After Proximal Femoral Fracture

Cause of Death	No. (%)	
	Surgically Treated Patients (n=53)	Nonsurgically Treated Patients (n=9)
Deterioration of preexisting comorbidities	10 (18.9)	6 (66.7)
Cerebrovascular disease	9 (17)	0 (0)
Aspiration pneumonia	11 (20.8)	2 (22.2)
Pneumonia	4 (7.5)	0 (0)
Malignancy	1 (1.9)	0 (0)
Insensescence	6 (11.3)	1 (11.1)
Sepsis	2 (3.8)	0 (0)
Acute myocardial infarction	2 (3.8)	0 (0)
Multiple organ failure	2 (3.8)	0 (0)
Pulmonary embolism	1 (1.9)	0 (0)
Unknown	5 (9.4)	0 (0)

# PREVIOUS NON-TRAUMATIC FRACTURES

Regardless of the  
bone density,  
a previous non  
traumatic fracture

predicts future  
fractures

Roma, 8-11 novembre 2018

ITALIAN CHAPTER

# BONE DENSITY AND BONE QUALITY

- Bone density is a part of bone quality
- Bone quality extends beyond bone density
  - Sound nutrition: vit D- vit K-Mg-Ca...
  - Digestive health
  - Exercise
  - Collagen disorder + other disease or drugs affecting bone

Roma, 8-11 novembre 2018

ITALIAN CHAPTER

# BONE DENSITOMETRY

osteoporosis diagnosis

risk of fracture

effect of treatment

Roma, 8-11 novembre 2018

ITALIAN CHAPTER

# Who Should Have a Bone Density Test?

## INDICATION

Women age 65 and older  
Men age 70 and older

Postmenopausal women and men (ages 50-69 )  
with clinical risk factors

Adults who have a fragility fracture

Adults with a condition (e.g., rheumatoid arthritis) or taking  
a medication (e.g., glucocorticoids) associated with low  
bone mass or bone loss

# BONE DENSITOMETRY

ITALIAN CHAPTER

Roma, 8-11 novembre 2018

## HOLOGIC LUNAR

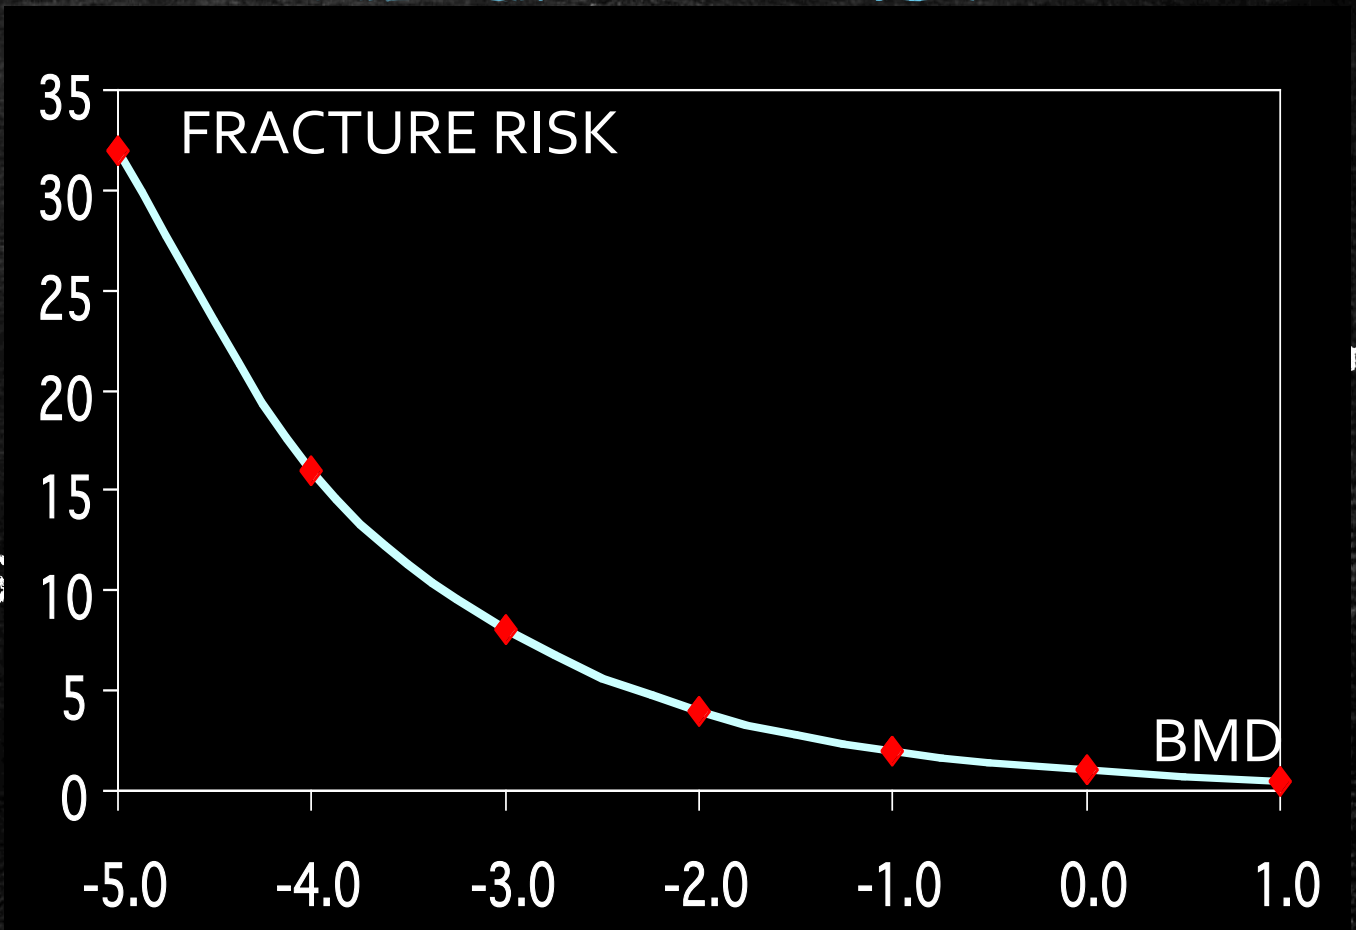

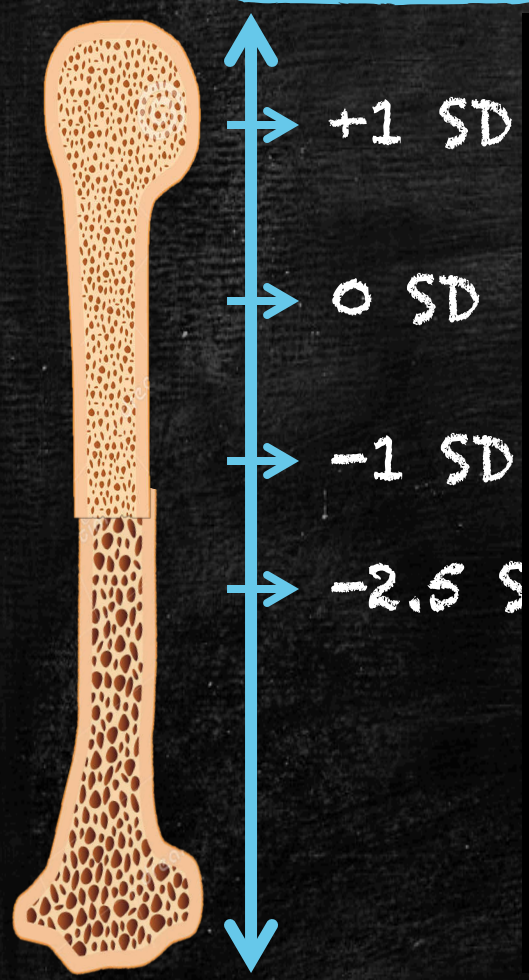

DXA itself uses an X-ray tube to generate two energy X-ray beams of different energies: one "low-energy" X-ray beam of 40 keV and one "high-energy" X-ray beam >70 keV.

two energy beams enables subtraction of the soft tissue component as they become attenuated differently and are recorded by a flexible detector arm

# BONE MASS DEFINITION ACCORDING TO WHO

Low bone mass is the single best predictor of future fracture risk

ITALIAN CHAPTER

Roma, 8-11 novembre 2018

# DEXA REPORTS

## Best Practices

Best Practices for Dual-Energy X-ray Absorptiometry (DEXA) Measurement and Reporting

E. Mich...

I see NO good reason to act my age!

age!

ooooo Hoooooo!

The WHO criteria are NOT applicable to premenopausal women men under age 50 yr children Adolescents

USE Z-SCORE

(-15% of bone)

- BA
  - SD=
  - T-score
  - Z-score
- normal controls (26-29y F or M)  
age matched controls

Roma, 8-11 novembre 2018

ITALIAN CHAPTER

# DEXA REPORT - OSTEOPOROSIS DEFINITION

- Diagnosis of OP can be made if the T-score is  $-2.5$  SD or lower in any of the following anatomical site:
  - Femoral Neck
  - Total Hip
  - Lumbar Spine - minimum of 2 vertebra
  - Forearm distal 1/3 site. Non dominant arm.

Best Practices

Best Practices for Dual-Energy X-ray Absorptiometry  
Measurement and Reporting: International Society for Clinical  
Densitometry Guidance

E. Michael Lewiecki,<sup>\*1</sup> Neil Binkley,<sup>2</sup> Sarah L. Morgan,<sup>3</sup> Christopher R. Shuhart,<sup>4</sup>  
Bruno Muzzi Camargos,<sup>5</sup> John J. Carey,<sup>6</sup> Catherine M. Gordon,<sup>7</sup>  
Lawrence G. Jankowski,<sup>8</sup> Joon-Kiong Lee,<sup>9</sup> and William D. Leslie<sup>10</sup> on behalf of  
the International Society for Clinical Densitometry

***There Is a Single Diagnosis Reported for Each Patient, Not a Different Diagnosis for Each Skeletal Site Measured***

Comment. The ISCD Official Positions state that osteoporosis may be diagnosed in postmenopausal women and in men aged 50 yr and older if the T-score of the lumbar spine, total proximal femur, femoral neck, or 33% radius is  $\leq -2.5$ ,

Roma, 8-11 novembre 2018

ITALIAN CHAPTER

# A SINGLE BONE DENSITY DOES NOT MEAN THAT BONE LOSS IS OCCURRING

Serial bone density comparison and lab test help to establish if bone is stable or if bone loss is occurring

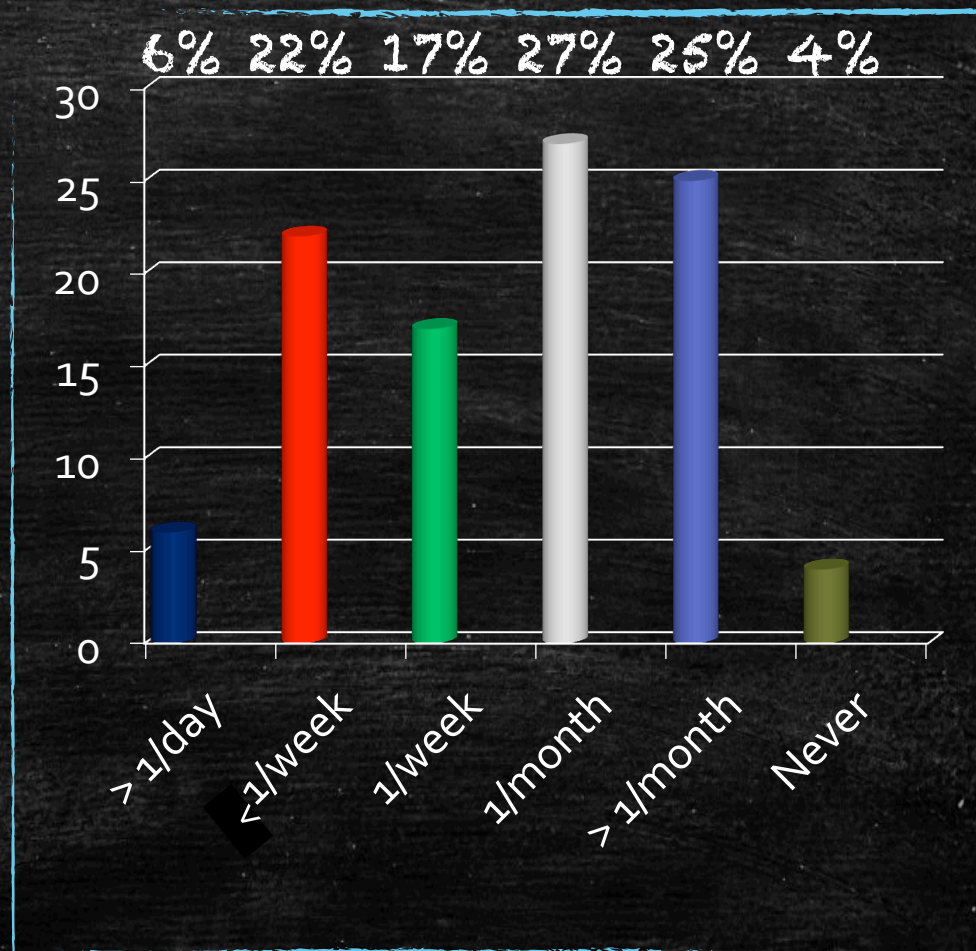

MAY BE THEY NEVER GAINED A GOOD PEAK BONE MASS

# DEXA ISCD HIGH RATE OF INCORRECT INTERPRETATION

HOW OFTEN DO YOU SEE A PATIENT WITH A DXA REPORT THAT IS INCORRECT?

Roma, 8-11 novembre 2018

ITALIAN CHAPTER

Lewiecky em J clin endocrinol 2006

## ... IN THE BEGINNING...

DXA is the best first line and follow-up test?

Low radiation

Best if the facility has conducted a precision assessment, quantifying their least significant change (LSC). If they have done this, the LSC will be on the radiological report.

Roma, 8-11 novembre 2018

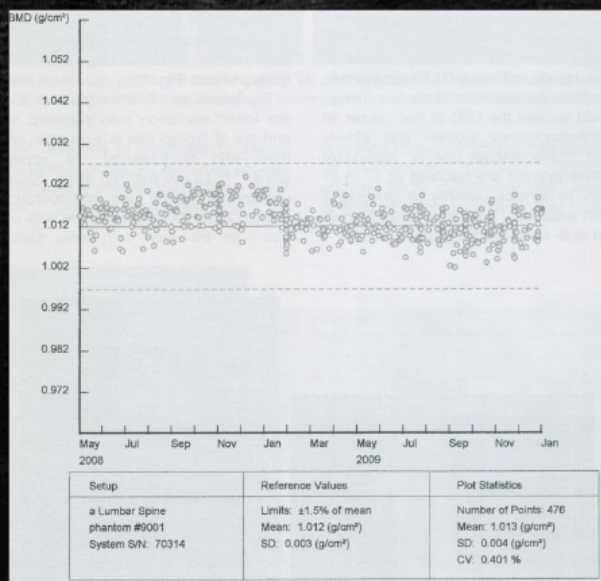

# DXA FACILITY

ITALIAN CHAPTER

The quality control (QC) program at a DXA facility should include adherence to manufacturer guidelines for system maintenance

- Perform periodic ( at least once a week) phantom scans for any DXA system
- Plot and review data from calibration and phantom scans

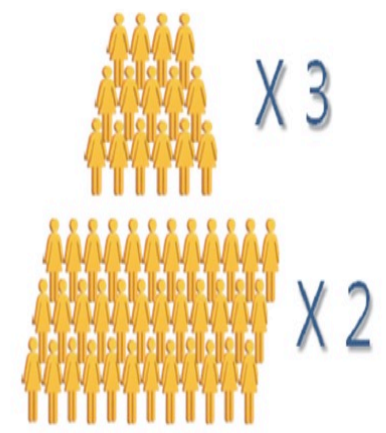

- Each DXA facility should determine its precision error and calculate the LSC
- If more than 1 technologist an average precision error and LSC should be used

# PRECISION ANALYSIS

To perform a precision analysis:

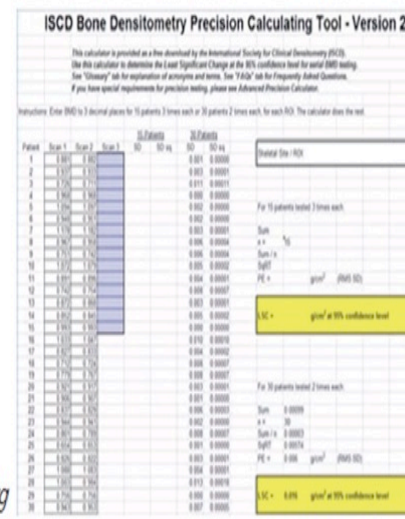

- Measure 15 patients 3 times, or 30 patients 2 times, repositioning the patient after each scan,
- Calculate the root mean square standard deviation for the group
- The ISCD and others have developed online calculators to facilitate this process

X 3

X 2

$$SD_{RMS} = \sqrt{\frac{\sum_{i=1}^m (SD^2)}{m}}, \quad CV_{RMS} = \sqrt{\frac{\sum_{i=1}^m (CV^2)}{m}}$$

ISCD Bone Densitometry Precision Calculating Tool - Version 2.1

This calculator is provided as a free download by the International Society for Clinical Densitometry (ISCD). Use this calculator to determine the Least Significant Change at the 95% confidence level for serial BMD testing. See "History" link for explanation of concepts and terms. See "FAQ" link for frequently asked questions. If you have special requirements for precision testing, please see Advanced Precision Calculation.

Instructions: Enter BMD in 3 decimal places for 15 patients 3 times each or 30 patients 2 times each for each BMD. The calculator does the rest.

ITALIAN CHAPTER

# DETERMINATION OF LSC

- Calculate LSC for the group at 95% confidence interval.
- LSC is calculated by multiplying 2.77 to precision error
- The minimum acceptable precision for an individual technologist is:
  - Lumbar spine: 1.9% (LSC = 5.3%),
  - Total hip: 1.8% (LSC = 5.0%),
  - Femoral neck: 2.5% (LSC = 6.9%),
- Retraining is required if a technologist's precision is worse than these values.

ISCD Bone Densitometry Precision Calculating Tool

Version 2.1

This calculator is provided as a free download by the International Society for Clinical Densitometry (ISCD). Use this calculator to determine the Least Significant Change at the 95% confidence level for serial BMD testing. If you have special requirements for precision testing, please see Advanced Precision Calculator.

Instructions: Enter BMD to 3 decimal places for 15 patients 3 times each or 30 patients 2 times each, for each ROI. The calculator does the rest.

# DEXA: GOLD STANDARD?

---

YES AND NO!!!

The usefulness of DEXA depends on:

- The skill of the **technician** - patient set up and analysis of scans
- The **radiologist's** skill to oversee and correct the technician errors
- The **clinician's** efforts to analyze computerized report carefully much like looking at x-rays

Roma, 8-11 novembre 2018

### Numbering of vertebral bodies

- ◆ The ribs appear at T12
- ◆ The largest transverse processes are L3
- ◆ Vertebral area values increase from L1 to L4
- ◆ BMD increases from L1 to L3, and the BMD of L4 is similar to or slightly less than that of L3
- ◆ Helpful markers are the iliac crest, usually at the L4-L5 interspace, and lowest set of ribs, usually at T12

Milano, 11/03/2004

### M.O.C. VERTEBRALE

L'esame è stato condotto sulla sola sede vertebrale non essendo valutabile la densità ossea femorale in presenza di impianto protesico bilaterale.

I valori di densità ossea del tratto vertebrale L2-L4 risultano sensibilmente sovrastimati per concomitanti fenomeni spondilo-artrosici pertanto, pur apparentemente conservati nei limiti di norma, vanno considerati scarsamente affidabili in termini diagnostici.

Lo Specialista  
Dr. SERGIO ORTOLANI

rc 16/03/2004

### VALORI DI RIFERIMENTO

BMD totale:

L1 - L4 0.830 - 1.350 (g/cm<sup>2</sup>)

L2 - L4 0.850 - 1.350 (g/cm<sup>2</sup>)

# HIP

ITALIAN CHAPTER

Roma, 8-11 novembre 2018

## HIP MUST BE INTERNALLY ROTATED

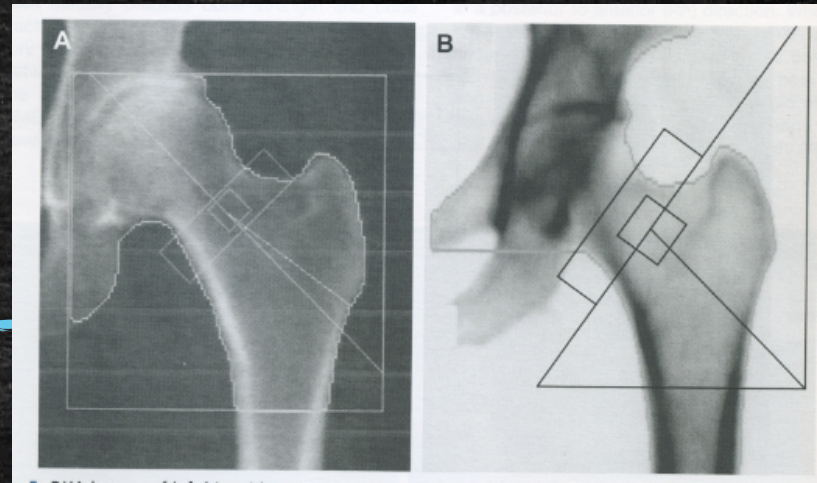

proximal femur: supine with lower extremity internally rotated  $15^{\circ}$ - $30^{\circ}$  and slightly abducted to keep femoral axis straight.

# HIP

## Anatomic Regions of Interest (ROIs)

- Total Hip
- Femoral Neck

## Why Not Use Ward's Area?

- Using Ward's area would overestimate the prevalence of osteoporosis
- It is a small calculated area of the mid portion of the femoral neck where BMD is the lowest - not a well defined anatomic region
- Poor precision and accuracy
- Not part of WHO (World Health Organization) criteria for BMD classification

# FEMUR: INTERNALLY ROTATED

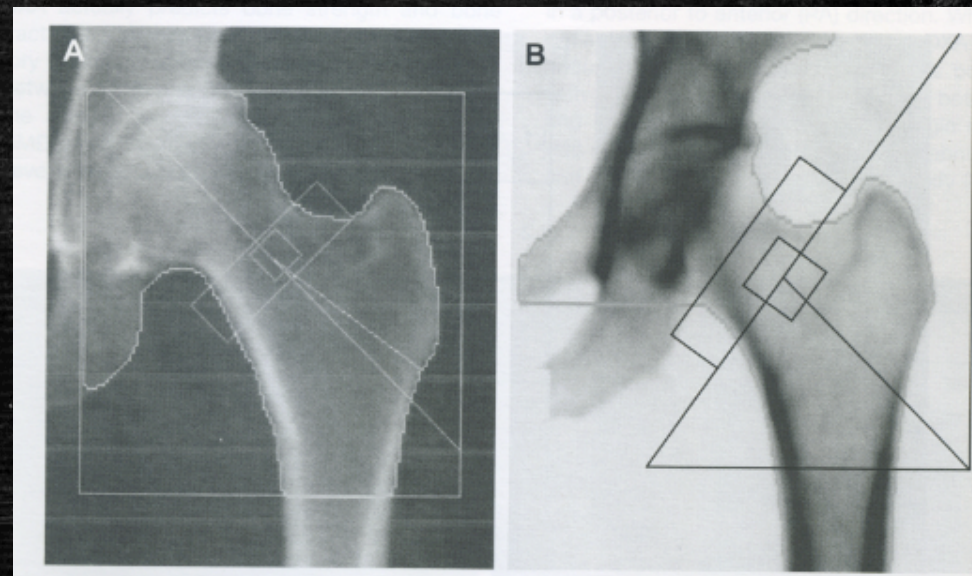

- Shaft of femur should be parallel with the long axis of the table
- Hip must be internally rotated of 15°
- If patient cannot rotate, then make sure technician tries to reproduce the same positioning for the follow-up scans

# PROXIMAL FEMUR: OPTIMAL POSITIONING

- Femur shaft is straight
- Leg internally rotated
  - Lesser trochanter small or not seen  
(lesser trochanter is a posterior structure)
  - Its size is the best indicator of internal rotation
- Scan includes
  - Ischium
  - Greater trochanter

World Health Organization Body Mass Index Classification  
BMI = 25.9 WHO Classification Obesity I

Underweight Normal Overweight Obesity I Obesity II Obesity III

BMI has some limitations and an actual diagnosis of overweight or obesity should be made by a health professional. Obesity is associated with heart disease, certain types of cancer, type 2 diabetes, and other health risks. The higher a person's BMI is above the greatest their weight-related risk.

# VFA: VERTEBRAL FRACTURE ASSESSMENT

Vertebral Fracture Assessment (VFA) is the correct term to denote densitometric spine imaging performed for the purpose of detecting vertebral fractures.

- Very low radiation
- Not as good as plain film but good enough to view spine for fractures
- Not all facilities offer this
- Takes about 10-15 minutes

# Indications for VFA

Lateral Spine imaging with Standard Radiography or Densitometric VFA is indicated when T-score is  $< -1.0$  and of one or more of the following is present:

- Women age  $\geq 70$  years or men  $\geq$  age 80 years
- Historical height loss  $> 4$  cm ( $>1.5$  inches)
- Self-reported but undocumented prior vertebral fracture
- Glucocorticoid therapy equivalent to  $\geq 5$  mg of prednisone or equivalent per day for  $\geq 3$  months

The decision to perform additional imaging must be based on each patient's overall clinical picture, including the VFA result.

# TBS TRABECULAR BONE SCORE

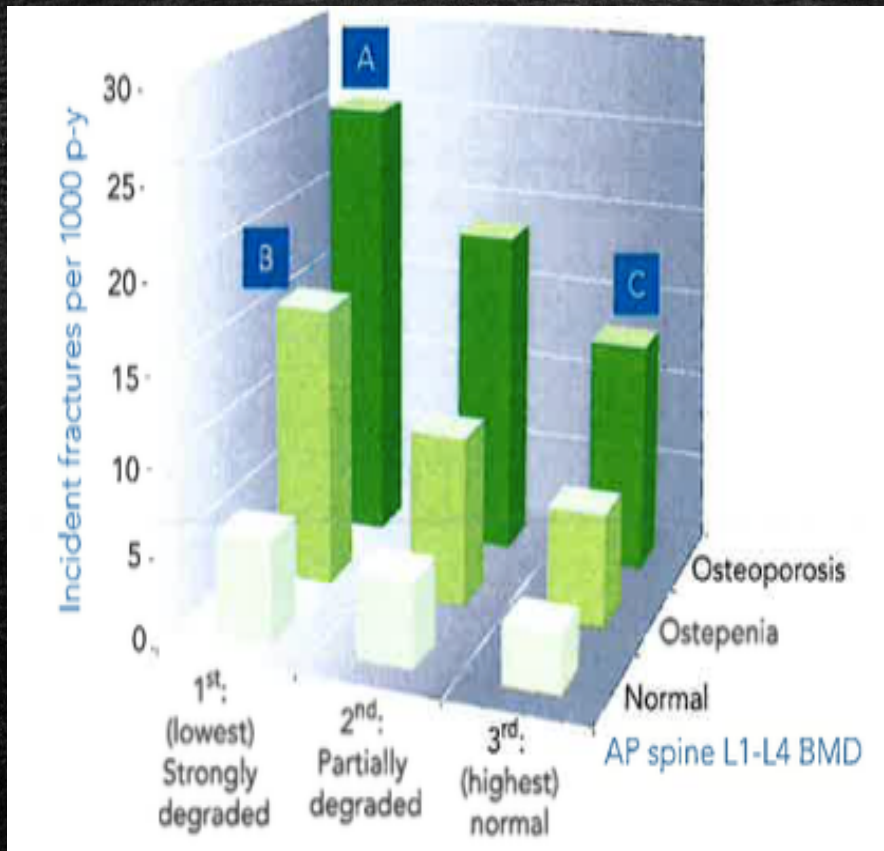

is a gray-level textural metric that can be extracted from the two-dimensional lumbar spine dual-energy X-ray absorptiometry (DXA) image

TBS is undirectly related to bone microarchitecture

# TBS and BMD

## RISK CLASS

>1.300 - normal

1.200-1.300 - intermediate risk

<1.200 - high risk

- is associated with vertebral, hip and major osteoporotic - fracture risk in **postmenopausal women**
- is associated with hip fracture and with major osteoporotic fracture risk in **men over the age of 50 ys**
- should **not be used alone** to determine treatment recommendations in clinical practice
- **can be used with FRAX and BMD** to adjust FRAX probability of fracture in postmenopausal women or older men
- is **not useful for monitoring** bisphosphonate treatment in postmenopausal women with osteoporosis
- is associated with major osteoporotic fracture risk in postmenopausal women with **type 2 diabetes**

## TRABECULAR BONE SCORE 2015 ISCD Official Position

# WHEN DO YOU ORDER A FOLLOW-UP DEXA

- ORDER THE FOLLOW-UP WHEN YOU ANTICIPATE THAT THE **LOSS OR GAIN** WILL SURPASS THE LEAST SIGNIFICANT CHANGE (LSC) FOR THE DEXA CENTER
- MAKE SURE THAT THE FACILITY USES **ORIGINAL TEMPLATE** - NO NEW ART WORK ON LUMBAR SPINE
- REQUEST THAT THE REPORT INCLUDE THE **DIAGNOSTIC PAGES**

# DXA REPORT: OPTIMAL ITEMS

- Recommendation for **further non BMD testing**, such as X-ray, magnetic resonance imaging, computed tomography, etc....
- Recommendations for pharmacological and non-pharmacological **interventions**
- Addition of the percentage compared to reference population
- **Specific recommendation** for evaluation of secondary osteoporosis

# DXA REPORT: ITEMS THAT SHOULD NOT BE INCLUDED

- a statement that there is **bone loss** without **knowledge** of previous bone density.
- mention of **"mild"**, **"moderate"** or **"marked"** osteopenia or osteoporosis
- **separate diagnosis** for different ROI (e.g. osteopenia at the hip and osteoporosis at the lumbar spine)
- expressions such as "she has the **bone of an 80-year-old**", if the patient is not 80 year-old
- results from skeletal sites that are not technically valid
- the **change in BMD** if it is not a **significant change** based on the precision error and LSC

---

.....HAPPY ENDING.....

# SCAN ACQUISITION AND ANALYSIS

- 1.1. One practicing **DXA technologist** has a valid certification in bone densitometry.
- 1.2. Each **DXA technologist** applies manual-instruction-standards for BMD measurement.
- 1.3. Each **DXA facility** has detailed standard operating procedures for DXA performance.
- 1.4. The **DXA facility** must comply with all applicable radiation safety requirements.
- 1.5. **Spine phantom** BMD measurement is performed at least once weekly to document stability of DXA performance over time (BMD values tolerance of  $\pm 1.5\%$ )
- 1.6. Each **DXA technologist** has performed in vivo precision assessment and the facility LSC has been calculated.
- 1.7. The **LSC** for each DXA technologist should not exceed
  - 5.3% for the lumbar spine
  - 5.0% for the total proximal femur
  - 6.9% for the femoral neck

Roma, 8-11 novembre 2018

ITALIAN CHAPTER

# INTERPRETATION AND REPORTING

- 2.1. At least 1 practicing **DXA interpreter**, and preferably all, has a valid certification in bone densitometry.
- 2.2. The **DXA manufacturer and model** are noted on the report.
- 2.3. The **DXA report** includes a statement regarding scan factors that may adversely affect acquisition/analysis quality and artifacts/confounders, if present.
- 2.4. The **DXA report** identifies the skeletal site, region of interest, and body side for each technically valid BMD measurement.
- 2.5. There is a **single diagnosis** reported for each patient, not a different diagnosis for each skeletal site measured.
- 2.6. A **fracture risk assessment tool** is used appropriately.
- 2.7. When reporting differences in BMD with **serial measurements**, only those changes that meet or exceed the LSC are reported as a change.
