MEDIAMENTE 1 NUOVO CASO DI INSUFFICIENZA CORTICOSURRENALICA PRIMITIVA AL GIORNO

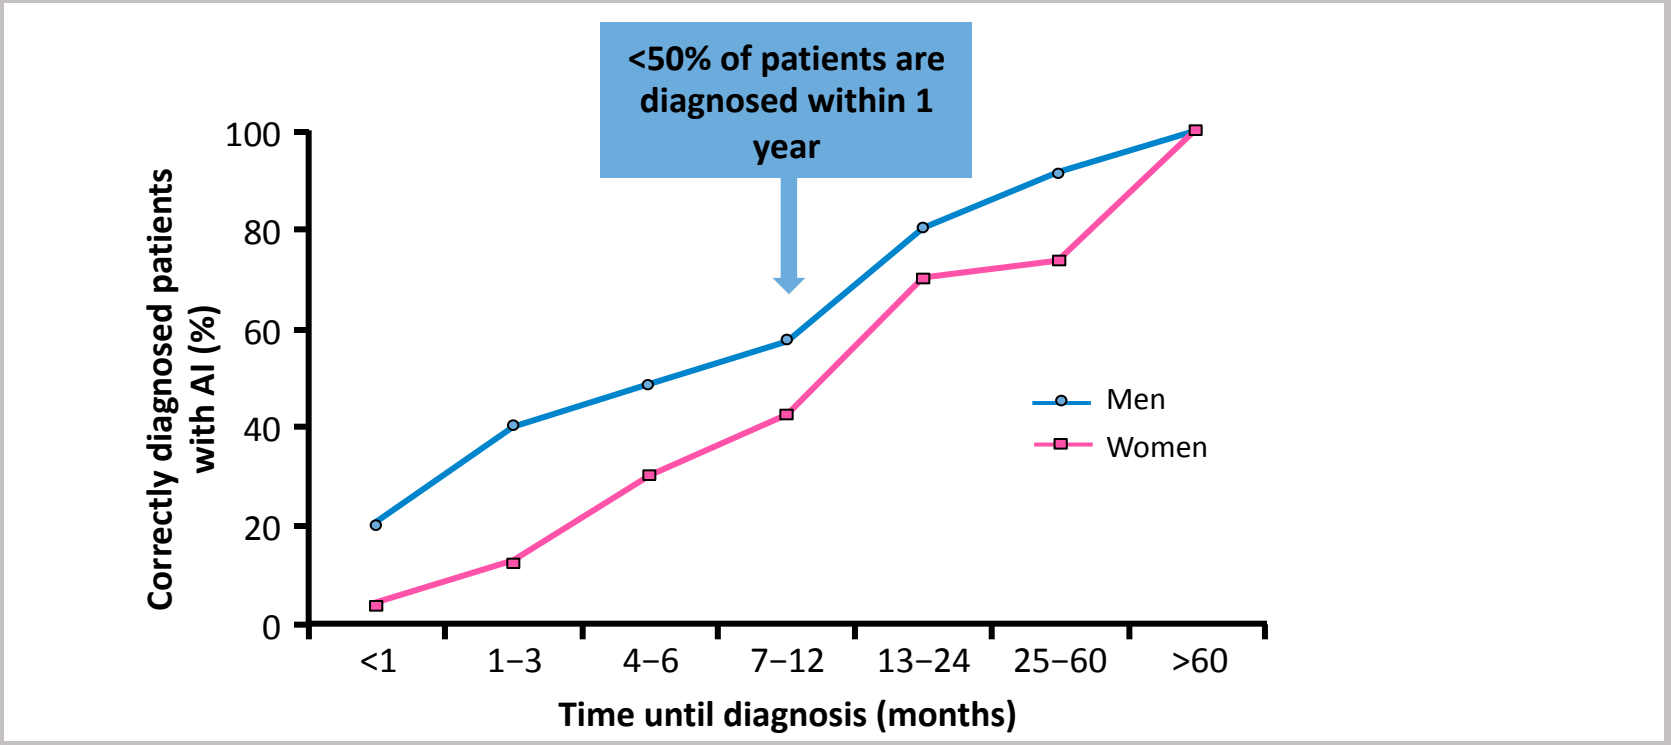
Signs and symptoms of chronic adrenal insufficiency[1]

Symptoms	Signs
• Fatigue, lack of stamina, reduced strength • Anorexia, weight loss • Gastric pain, nausea, vomiting • Myalgia, joint pain • Dizziness • Dry and itchy skin (in women) • Loss of libido (in women) • **Salt craving**	• Fever • Low blood pressure, postural hypotension • Hyponatraemia • Anaemia, lymphocytosis, eosinophilia • Hypoglycaemia • Loss of axillary or pubic hair (in women) • **Skin hyperpigmentation** • **↑ serum creatinine** • **Hyperkalaemia** • **Hypercalcaemia** • **Very pale skin**

Primary AI only
Secondary AI only

1. Arlt W and Allolio B. Lancet 2003;361:1881–1893

Delayed diagnosis of adrenal insufficiency is common in clinical practice[1]



- 67% of patients consulted ≥3 physicians before being correctly diagnosed
- 68% of patients incorrectly diagnosed initially
  - Psychiatric and gastrointestinal disorders most common incorrect diagnoses

Figure adapted from Bleicken et al. Reproduced bypermission.

Table 1. Clinical Features of Adrenal Insuffi

Symptoms	Signs
Adrenal insufficiency	
Fatigue	Hyperpigme areas, ski breast
Weight loss	Low blood
Postural dizziness	Failure to th
Anorexia, abdominal discomfort	
Adrenal crisis	
Severe weakness	
Syncope	Hypotensio
Abdominal pain, nausea, vomiting; may mimic acute abdomen	Abdominal
Back pain	Reduced co
Confusion	

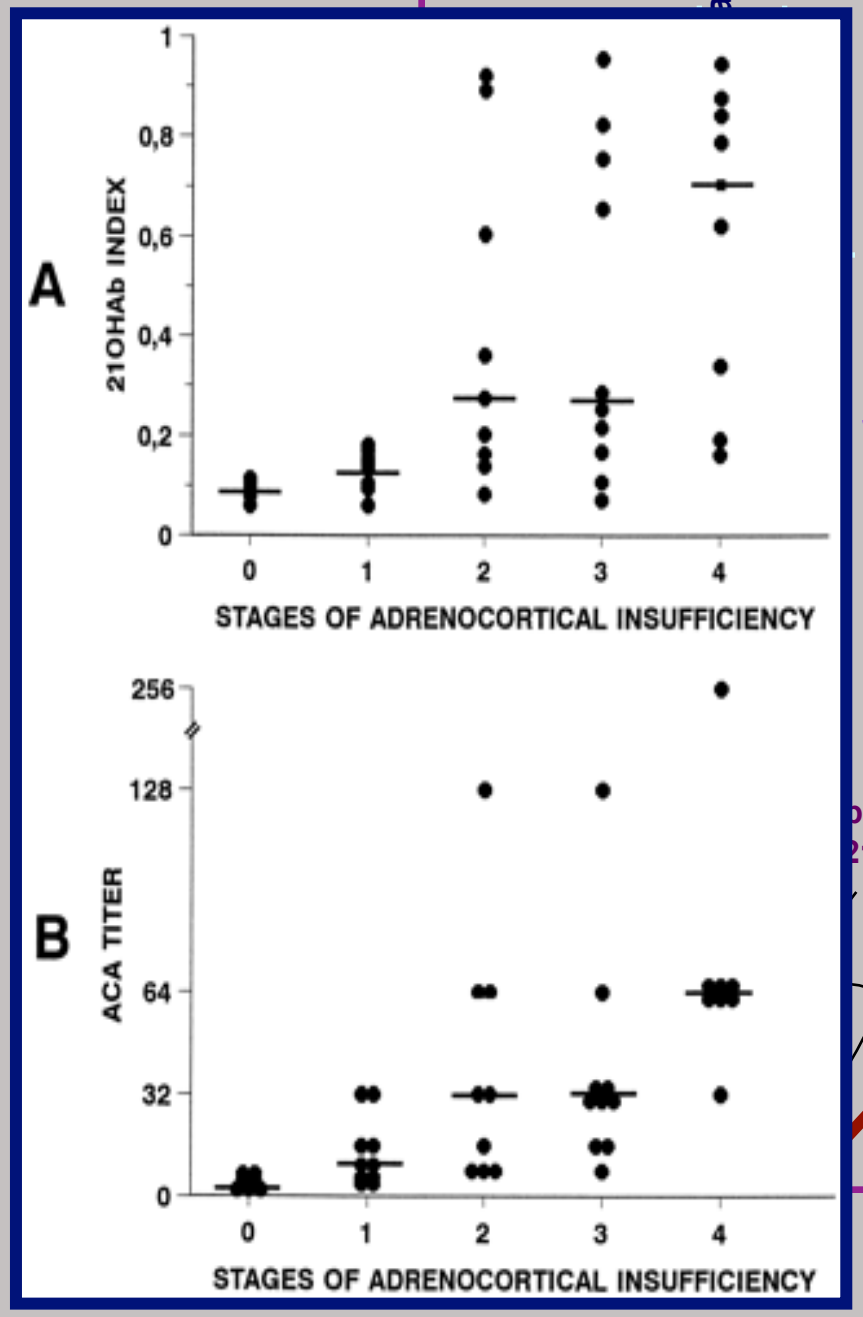
2.0 Optimal diagnostic tests

2.1 We suggest the standard dose (250 μg for adults and children ≥2 y of age, 15 μg/kg for infants, and 125 μg for

2.4 We recommend measurement of plasma ACTH to establish PAI. The sample can be obtained at the same time as the baseline sample in the corticotropin test or paired with the morning cortisol sample. In patients with confirmed cortisol deficiency, a plasma ACTH >2-fold the upper limit of the reference range is consistent with PAI. (1|⊕⊕⊕◯)

2.5 We recommend the simultaneous measurement of plasma renin and aldosterone in PAI to determine the presence of mineralocorticoid deficiency. (1|⊕⊕⊕◯)

Falorni A & Laureti S, The Endocrinologist, 2000



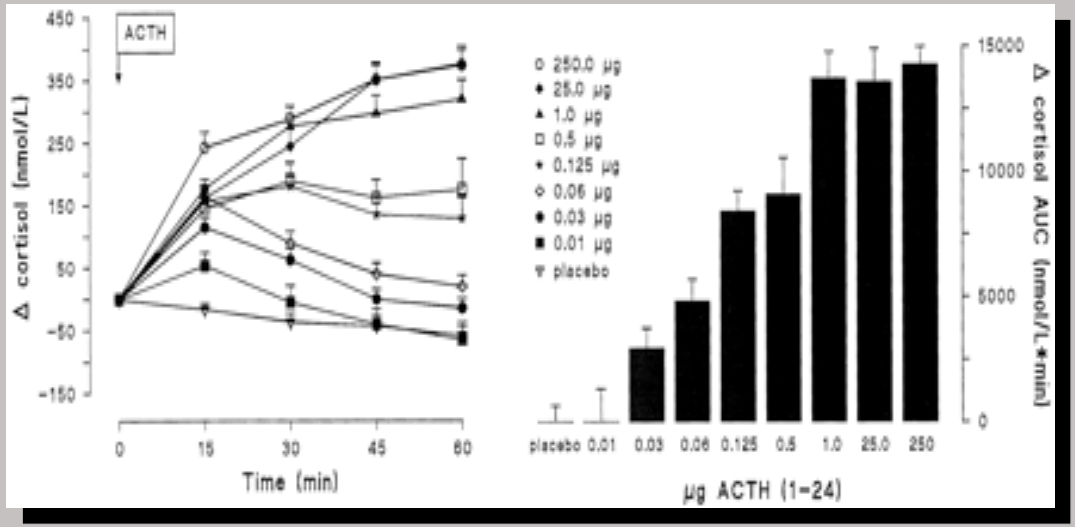
Insufficienza cortico-surrenalica
Pre-clinica
ACTH-test normale: 15% progressione
ACTH-test sub-normale: 90% progressione

Laureti S et al. JCEM 1998

Insufficienza cortico-surrenalica primitiva DIAGNOSI

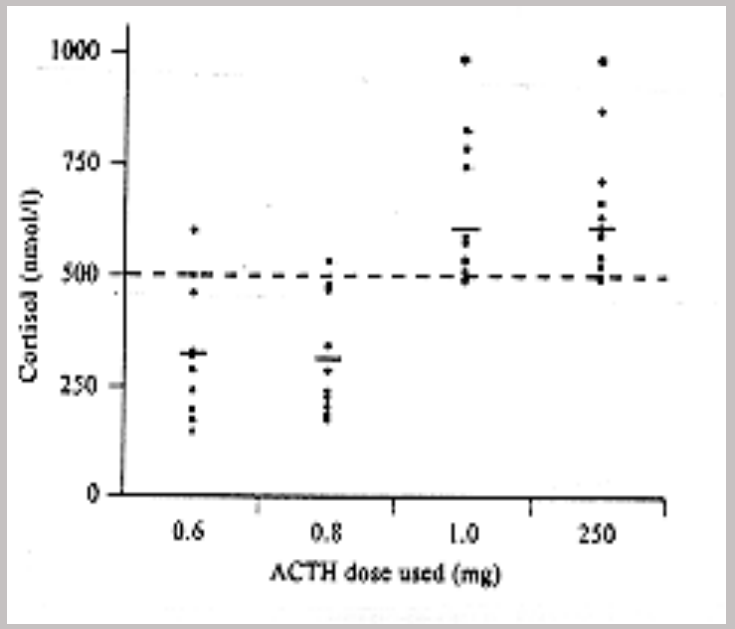
• ACTH basale	> 100 pg/ml
• Cortisolo basale	< 5 μg/dl
• Cortisolo dopo Synacthen 250 μg (HDT)	< 18.1-20 μg/dl
• Cortisolo dopo Synacthen 1 μg (LDT)	< 18.5 μg/dl
• Cortisolo basale (in acute illness)	< 9 μg/dl

The lowest dose of synthetic ACTH able to induce a maximal stimulation of the adrenal cortex is 1 μg (LDT test)

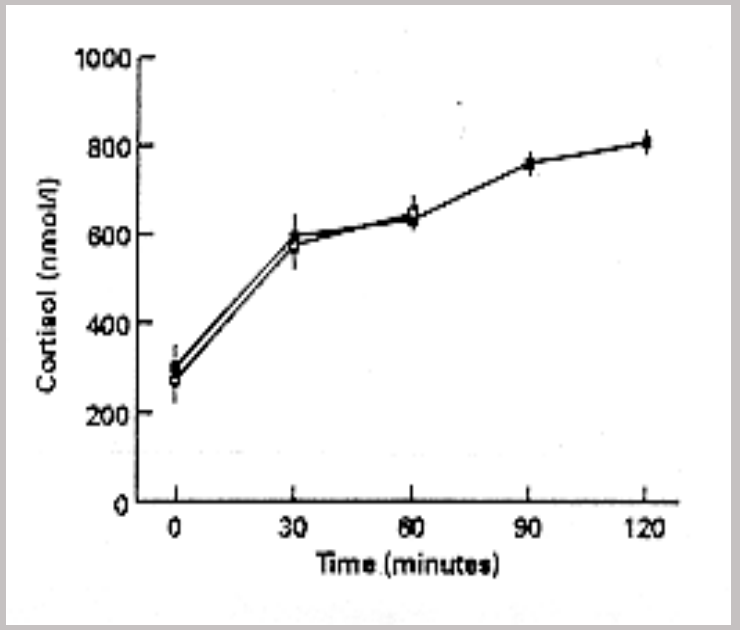


Arvat et al, JCEM 2000

Plasma concentration of cortisol after LDT and HDT



Dickstein G et al Eur J Endocrinol 1996



Laureti S et al Clin Endocrinol 2000

Table 2 *Classification and causes of primary adrenal insufficiency*

Aetiology	Pathogenesis	Diagnosis
Autoimmune	T and B cell autoimmunity against adrenocortical cells	21OH-Ab
Infection	Mycobacteria	Culture, Quantiferon test, PCR, adrenal CT
	Bacteria (e.g. meningococcus and Haemopholus influenzae)	
	Fungus (e.g. *Pneumocystis carinii*)	
	Virus (e.g. HIV, herpes simplex and cytomegalovirus)	
Bleeding	Antiphospholipid syndrome	Evidence of bleeding on adrenal CT
	Anticoagulant therapy	
	Disseminated intravascular coagulation	
Surgery	Tumour surgery, Cushing's syndrome, Radical nephrectomy	
Genetic	Congenital adrenal hyperplasia	Urine steroid profile, sequencing of steroidogenic genes (e.g. *CYP21B*)
	Adrenoleukodystrophy	Measure VLCFA
	Hypogonadotrophic hypogonadism,	Sequencing of *NR0B1 (DAX1)*
	Familiar glucocorticoid deficiency (ACTH resistance syndrome), Smith–Lemli–Opitz syndrome, mitochondrial forms (Kearns–Sayre syndrome)	
Infiltrative	Amyloidosis, haemochromatosis, bilateral adrenal metastasis or lymphoma, xanthogranulomatosis	
Medication	Ketoconazole, etidomate, mitotane, metyrapone

The HPA axis and normal adrenal function

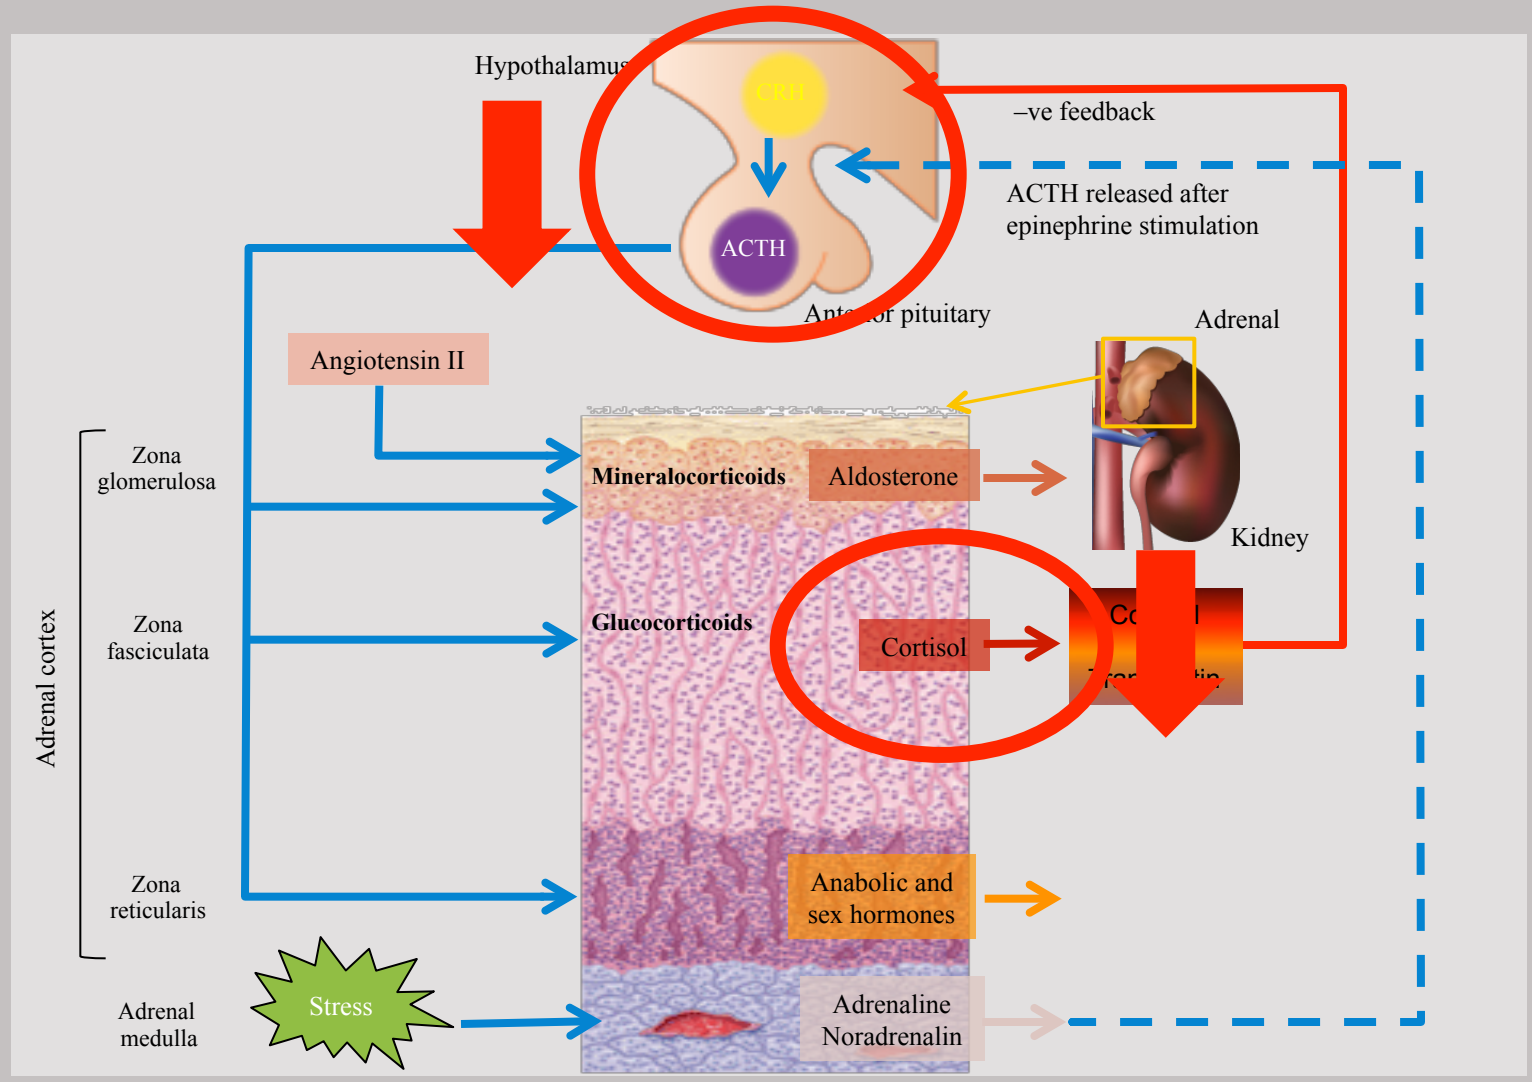

Figure adapted with permission of McGraw-Hill Education. The University of Toledo, Anatomy & Physiology Revealed Version 3.0 DVD © 2012.

Iposurrenalismo secondario EPIDEMIOLOGIA

- **Con 150-280 casi per milione è la forma più frequente di iposurrenalismo**
- **Prevalente nelle donne**
- **Picco di età nella sesta decade**

Main causes of secondary adrenal insufficiency[1]

Diagnosis	Pathogenesis
Pituitary tumours	Usually adenomas (rarely carcinoma) Consequence of tumour growth, surgical treatment or both
Other tumours of the hypothalamic-pituitary region	Craniopharyngioma Meningioma Ependymoma Intrasellar or suprasellar metastases
Pituitary irradiation	Craniospinal irradiation in leukaemia Radiation for tumours outside the HPA axis Irradiation of pituitary tumours
Lymphocytic hypophysitis	May be isolated or associated with APS
Isolated congenital ACTH deficiency	Pro-opiomelanocorticotrophic cleavage defect?

APS: autoimmune polyendocrine syndrome

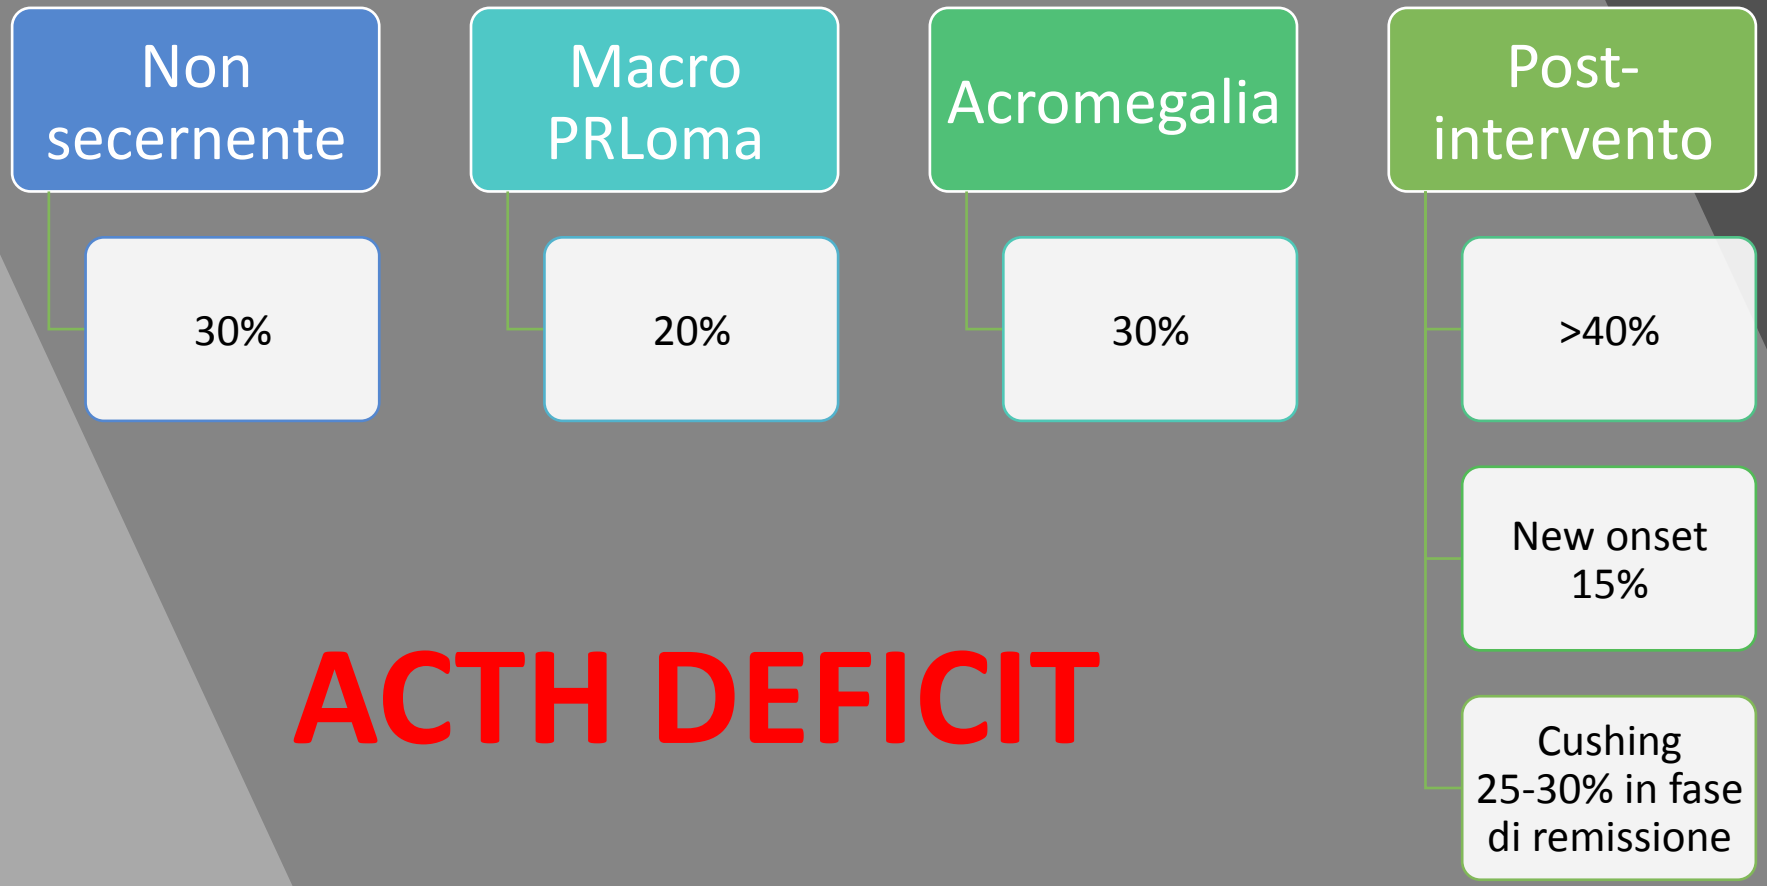
Una causa, una probabilità



ACTH DEFICIT

MALATTIE IPOFISARIE
Lesioni espansive: Adenomi; Cisti; Altri tumori benigni
Neurochirurgia dell'ipofisi
Radiazioni
Lesioni infiltrative: Ipofisiti; Emocromatosi
Sindrome di Sheehan
Apoplessia ipofisaria
Malattie Genetiche: Pit-1 mutazione

MALATTIE IPOTALAMICHE
Lesioni espansive benigne e maligne: Craniofaringioma; Metastasi (polmone, stomaco, ecc)
Processi infiltrativi: sarcoidosi ; Istiocitosi a cellule di Langerans
Radiazioni: ETP SNC / Naso-faringe
Traumi (fratture della base)
Infezioni: Meningite TBC

DEFICIT DI ACTH

• MENINGITI	30%
• EMORRAGIA SUB-ARACNOIDEA	16%
• TRAUMA CRANICO	11%
• RADIAZIONI ipotalamo-ipofisi (tradizionale)	60-80%
• RADIAZIONI ipotalamo-ipofisi (gamma-knife)	10-15%
• RADIAZIONI cranio (per tumori non ipofisari)	25%

LE DISFUNZIONI ENDOCRINE DA FARMACI INIBITORI DEI *CHECKPOINT* IMMUNITARI

Responsabile Editoriale
Renato Cozzi

Vincenzo Di Donna (dottdido@libero.it) **& Salvatore Maria Corsello**
UO di Endocrinologia, Università Cattolica del Sacro Cuore, Policlinico "A. Gemelli", Roma

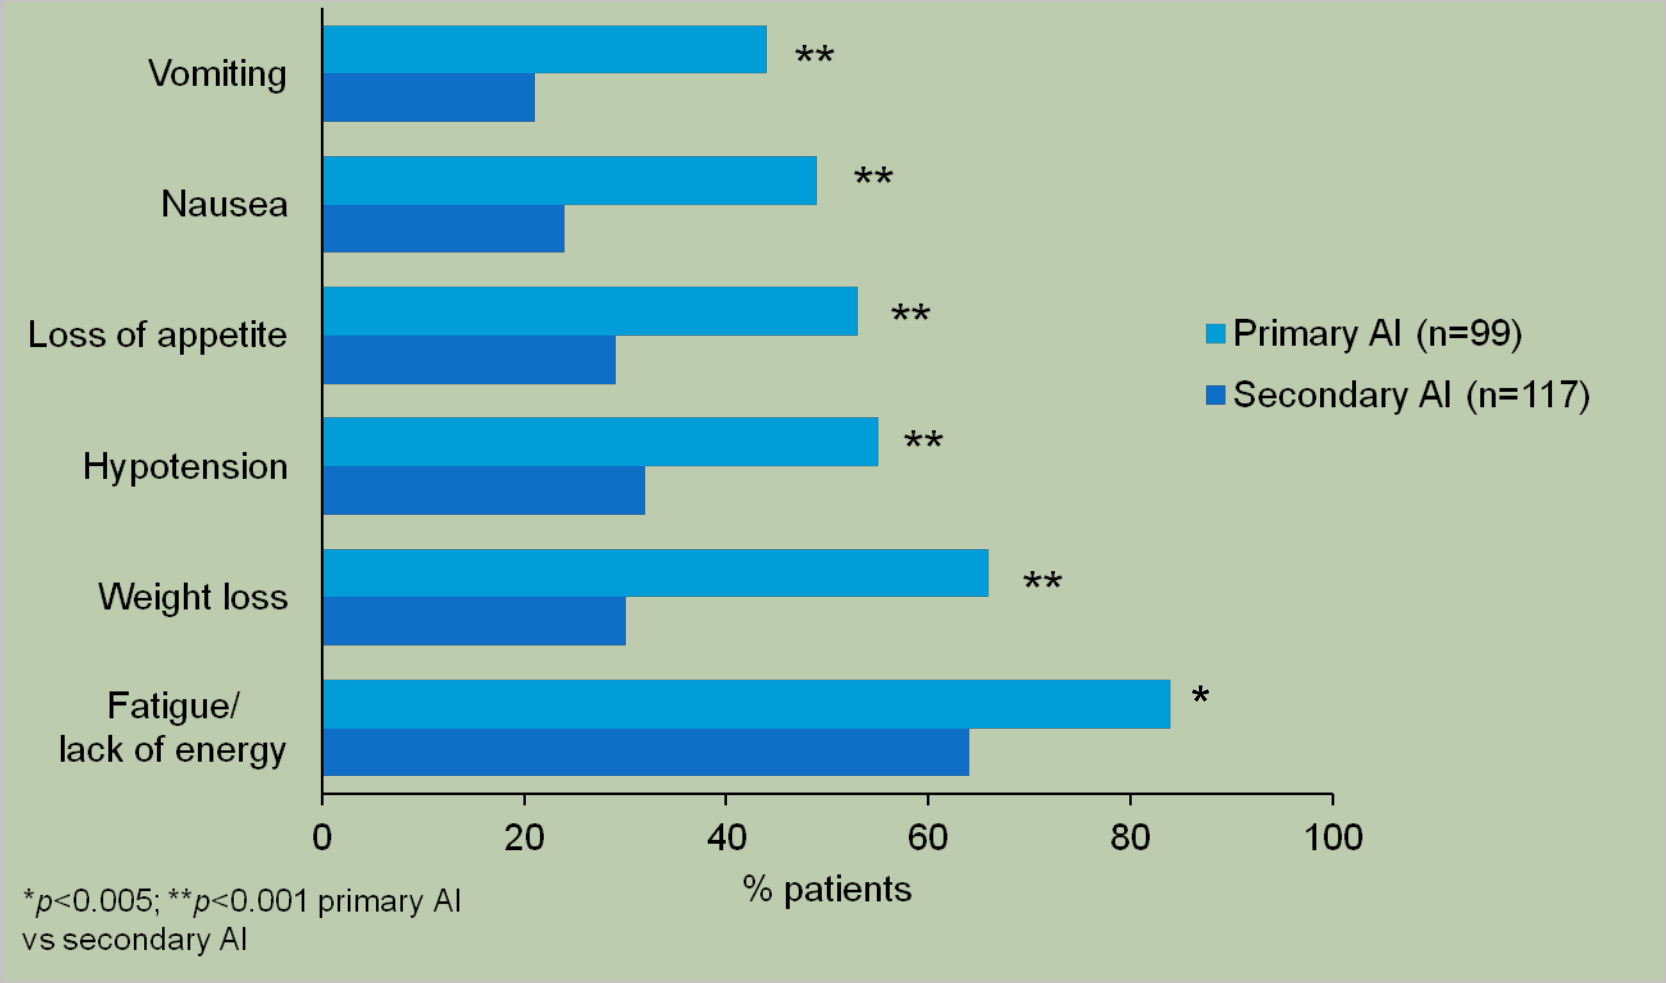
- Sono oggi disponibili anticorpi monoclonali anti-CTLA-4, anti-PD-1 e anti-PD-1 ligando per la terapia di pazienti affetti da melanoma e la maggior parte dei tumori solidi (in particolare cancro polmonare e renale). Tra le molecole approvate per la pratica clinica, ci sono ipilimumab e, più recentemente, pembrolizumab e nivolumab.
- L'**epoca di insorgenza degli effetti collaterali endocrini è di circa 9 settimane** (*range* 5-36) dopo l'inizio della terapia, ma sono possibili anche manifestazioni più precoci o tardive.
- In particolare, l'incidenza di ipofisite varia da 0 a 17% per ipilimumab, da 0.4 a 5% per tremelimumab ed è < 1% per nivolumab e pembrolizumab. In una recente metanalisi sull'argomento, Abdel-Rahaman e coll hanno riportato un **rischio relativo cumulativo** di ipofisite di **22.03** (IC95% 5.52-56.94, p < 0.00001).

- ipotiroidismo centrale: ~ 87%;
- ipogonadismo ipogonadotropo: ~ 85%;
- iposurrenalismo secondario: ~ 73%;
- deficit di GH: ~ 25%;
- ipo- (più spesso) o iperprolattinemia: ~ 25%.

In circa la metà dei casi, le disfunzioni tiroidea e gonadica possono essere reversibili, con una mediana di 10 e 13 settimane rispettivamente in uno studio, mentre l'iposurrenalismo è quasi sempre permanente, in maniera purtroppo non prevedibile.

STADIAZIONE PRE-TRATTAMENTO / MANAGEMENT IN CORSO DI TRATTAMENTO

Frequency of most common symptoms in primary and secondary adrenal insufficiency[1]



Results from a questionnaire survey of 216 patients with primary (46%) or secondary (54%) AI conducted in Germany. Data are symptoms at time of diagnosis.

1. Bleicken B et al. Am J Med Sci 2010;339:525–531

CENTRAL ADRENAL INSUFFICIENCY

1.0 Diagnosis of hypopituitarism

Central adrenal insufficiency

1.1 We suggest measuring serum cortisol levels at 8–9 AM as the first-line test for diagnosing central adrenal insufficiency (AI). (2⊕◯◯◯)

1.2 We recommend against using a random cortisol level to diagnose AI. (1⊕⊕◯◯)

1.3 We suggest that a cortisol level <3 μg/dL is indicative of AI and a cortisol level >15 μg/dL likely excludes an AI diagnosis. (2⊕◯◯◯)

- 1.4 We suggest performing a corticotropin stimulation test when morning cortisol values are between 3 and 15 g/dL to diagnose AI. Peak cortisol levels <18.1 mcg/dL (500 nmol/L) at 30 or 60 minutes indicate AI. (2⊗⊗◯◯)
- 1.5 We suggest that clinicians perform biochemical testing for the HPA axis at least 18–24 hours after the last HC dose or longer for synthetic GCs. (2⊗⊗◯◯)

ACTH

Insulin tolerance	Administer insulin, 0.05–0.15 U/kg iv. Sample blood at −30, 0, 30, 60, and 120 min for cortisol and glucose.	Glucose should drop <40 mg/dL (2.2 mmol/L). Peak cortisol should be >500–550 nmol/L (>18.1–20 μg/dL) depending on assay.
Corticotropin standard dose (250 μg)	Administer ACTH 1–24 (cosyntropin), 250 μg im or iv. Sample blood at 0, 30, and 60 min for cortisol.	Cortisol should be at 30 or 60 min >500–550 nmol/L (>18.1–20 μg/dL) depending on assay.
Corticotropin low dose (1 μg)	Administer ACTH 1–24 (cosyntropin), 1 μg iv. Sample blood at 0 and 30 min for cortisol.	Cortisol should be at 30 min >500 nmol/L (18.1 μg/dL) depending on assay.

ACTH Stimulation Tests for the Diagnosis of Adrenal Insufficiency: Systematic Review and Meta-Analysis

J Clin Endocrinol Metab, February 2016, 101(2):427–434

Table 1. Meta-Analysis Results: ACTH Stimulation Tests for the Diagnosis of Secondary Adrenal Insufficiency

	Estimate	95% CI
Adult High-Dose ACTH Stimulation Test		
Sensitivity	0.64	0.52–0.73
Specificity	0.93	0.89–0.96
Likelihood ratio for positive test	9.1	5.7–14.6
Likelihood ratio for negative test	0.39	0.30–0.52
Diagnostic odds ratio	23	13–42
Adult Low-Dose ACTH Stimulation Test		
Sensitivity	0.83	0.75–0.89
Specificity	0.86	0.78–0.91
Likelihood ratio for positive test	5.9	3.8–8.9
Likelihood ratio for negative test	0.19	0.13–0.29
Diagnostic odds ratio	30	18–50
Children High-Dose ACTH Stimulation Test		
Sensitivity	0.36	0.10–0.73
Specificity	0.99	0.81–0.99
Likelihood ratio for positive test	43.5	1–1891.2
Likelihood ratio for negative test	0.65	0.36–1.15
Diagnostic odds ratio	67	1–4152
Children Low-Dose ACTH Stimulation Test		
Sensitivity	0.69	0.28–0.93
Specificity	0.91	0.63–0.98
Likelihood ratio for positive test	7.7	1.3–44.8
Likelihood ratio for negative test	0.34	0.10–1.18
Diagnostic odds ratio	23	2–313

Table 2. ACTH Stimulation Tests for the Diagnosis of Secondary Adrenal Insufficiency Based on Cortisol Cutoff

Cortisol Cutoff (nmol/liter)	LR+	LR−	Diagnostic OR	No. of Studies	LR+	LR−	Diagnostic OR	No. r of Studies	*P* Value (for Difference)
Adults									
	High-Dose ACTH Test				**Low-Dose ACTH Test**				
500–30 minutes	6.3 (2.5–16)	0.32 (0.20–0.51)	20 (5–75)	6	NR	NR	NR	NR	NA
500–peak	12.4 (6.7–23.0)	0.48 (0.32–0.72)	26 (11–60)	14	7.1 (4.3–11.6)	0.21 (0.13–0.33)	34 (17–68)	11	.631
